

# Assignment: Build a Smart Python Tool for a Real-Life Education Use Case

---

## About Scoreazy

Scoreazy is an education-first company that blends psychology, AI, and smart design to build personalized learning experiences for school students. We focus on simplifying learning through innovative tools and student-centered content.

---

## About the Internship – Python Developer Intern

As a Python Developer Intern at Scoreazy, you'll design automation tools, data processors, and logic-based workflows that support personalized education experiences. This internship emphasizes your ability to solve real-world problems using Python — not full-stack development or frontend work.

---

## Objective

Choose a real-world scenario from the list below and design a Python-based tool or script that automates or simplifies the task. The goal is to evaluate your Python logic, understanding of libraries, and clarity of solution structure.

---

## Task Overview

Pick one use case from the list and propose a well-documented Python solution for it. The focus is on clean logic, appropriate library usage, and a clear workflow — not production-ready deployment or UI.

---

## ✓ Step 1: Choose ONE of the following scenarios

### 1. Image-to-LaTeX Converter with Rendering

Create a Python script that accepts a math question image and converts it into accurate LaTeX (with 95%+ accuracy). Then, render the LaTeX back into an image using a given formatting template so that the final output visually matches the original question image.

---

### 2. YouTube Transcript Fetcher from Google Sheet

Write a Python script that reads a list of YouTube video URLs from a Google Sheet or Excel file, fetches the transcript of each video (in English or Hindi), and saves the transcript next to each URL. The script should handle multiple videos and update the sheet row-by-row.

---

### 3. LinkedIn Profile Outreach Automation

Build a Python-based workflow that reads a list of LinkedIn profile URLs from a Google Sheet or Excel file and automatically sends each profile a connection request or message inviting them to join our community or follow our page.

---

## ✓ Step 2: Build and Document Your Python Tool

Structure your assignment as follows:

### 1. Tool Objective

A brief description of what your Python script/tool is supposed to do.

### 2. Input

Clearly define the inputs needed (e.g., topic name, PDF file, CSV file, student email, etc.).

### 3. Workflow

Explain your tool's process using numbered steps:

- How it is triggered (e.g., script run, user input, schedule)
- Step-by-step breakdown of tasks
- Python libraries/tools used (e.g., `pandas`, `PyPDF2`, `openpyxl`, `smtplib`, `requests`, `openai`, etc.)

### 4. Code Snippets

Include short, well-commented Python code snippets (or pseudocode if more appropriate) to demonstrate key logic.

**Full code is not required unless under 50 lines.**

### 5. Sample Output

Show a mock output such as:

- Example quiz
- Trend report
- Highlighted keywords
- Example email/WhatsApp message

---

## Guidelines

- Prioritize code clarity and logical flow
  - Use only relevant Python tools — no need for frontend or database integration
  - External APIs and dummy data are allowed
  - Keep explanations concise and structured
-

## Deliverables

1. Submit your assignment as a single Google Doc or PDF
2. Filename format:  
**YourName\_PythonAssignment**  
*Example: AaravShah\_PythonAssignment.pdf*
3. Your document should include:
  - Tool Objective
  - Input
  - Workflow
  - Code Snippets
  - Sample Output

---

## Estimated Effort

2–3 hours

---

 "We look forward to seeing how you creatively apply Python to build simple yet smart solutions for education workflows!"
